Professional Summary

Backendengineerwith 4+ years of experience building cloud-native SaaS platforms, distributed systems, and AI-native backend architectures for international remote clients. Deep hands-on focus in Go, Python, Kubernetes, AWS, gRPC, GraphQL, Kafka, Temporal, PostgreSQL, Redis, observability, RAG, tool-calling, and AI workflow orchestration. Architected LogiSynapse, an AI-native logistics intelligence platform for shipment visibility, support automation, incident investigation, carrier workflows, and billing reconciliation. Delivered an AWS EKS migrationthat reduced monthly cloud spend by 20%.

Technical Skills

Languages: Go,Python,TypeScript, JavaScript, SQL

Backend & APIs: gRPC,Protocol Buffers, GraphQL, REST APIs, WebSockets, Node.js, Express.js

Cloud & Platform: AWS,EKS, Lambda, SQS, SNS, RDS, DynamoDB, API Gateway, S3, Kubernetes, Docker, Helm, Terraform

Messaging & Workflows: Apache Kafka, RabbitMQ, Temporal, event-driven architecture, transactional outbox, idempotent processing

Databases & Caching: PostgreSQL, MongoDB, DynamoDB, Redis, ElastiCache, pgvector/Qdrant architecture

AI Engineering: RAG,embeddings, vector search, tool calling, structured outputs, AI agents, LangGraph/Temporal orchestration patterns, PromptOps, LLMops, model gateway, eval pipelines, groundedness and hallucination checks, OpenAI/Ollama/vLLM concepts

DevOps & Observability: Git, GitHub Actions, ArgoCD, Prometheus, Grafana, OpenTelemetry, structured logging, distributed tracing, pprof, AI evaldashboards

Professional Experience

• IndependentBackendArchitect & Strategic Technical Partner

Dec 2021 - Present

International freelance/contract client projects via Fiverr & Upwork

- Architected cloud-native SaaS backendsusing Go, Python,AWS,Kubernetes, Docker, Helm, Terraform, PostgreSQL, Kafka, Redis, and AI-assisted engineering workflows.
- Migrated a monolithic Node.js application to an auto-scaling Golang architecture on AWS EKS, reducing monthly cloud infrastructure cost by 20%.
- Engineered backend foundations for real-time intelligence and logistics platforms, translating founder requirements into system design, service boundaries, delivery plans, and production-ready APIs.
- Led async remote delivery across time zones through Git-based review flows, technical specifications, architecture notes, and implementation handoff documents.
- Maintained a consistent 5-star client rating across 10+ international projects by pairing hands-on backend execution with proactive stakeholder communication.

• Full-Stack Web Developer

Dec 2022 - Sep 2023

AlphaNotation,Chattogram,Bangladesh (Remote)

- Builtcustomer-facing web applicationsandinternal tools using React, Next.js, Node.js, Express.js, and MongoDB for dashboards, CMS workflows, reporting, and role-based user management.
- Designed secure REST APIs for authentication, authorization, CRUD workflows, and business operations, improving maintainability through clean backend separation.
- Optimized MongoDB schemas and read-heavy query paths with targeted indexes, improving responsiveness as operational data volume increased.
- Collaborated remotely with UI/UX and product stakeholders using Git workflows, API documentation, code review, and clear handoff notes.

Selected Project

• LogiSynapse:AI-Native Logistics Intelligence & Billing Platform

Flagship Project

BackendArchitect&Developer | Go, Python,gRPC,GraphQL,Kafka,Temporal,PostgreSQL/RDS, Redis, AWS EKS, Helm, Terraform, OpenTelemetry, Prometheus, Grafana, pgvector/Qdrant architecture

- Architected LogiSynapse as a multi-tenant logistics operatingplatformformerchants,operators,supportteams,dispatchers,finance teams, and SREs.
- Solved business problems around duplicate orders, weak shipment visibility, slow customer support, manual incident investigation, fragile carrier integrations, poor route decisions, missing audit trails, and billing mismatches.
- Designed the full shipment lifecycle: order intake, validation, shipment creation, carrier quote and route planning, label generation, tracking updates, exception handling, notification, usage billing, analytics, and AI-assisted investigation.
- Structured the architecture into product, data, workflow, and intelligence planes so APIs, PostgreSQL/Redis/Kafka/vector retrieval, Temporal workflows, and AI services can scale and fail independently.
- Mapped current services across authentication, shipment, workflow orchestration, billing, communications, and GraphQL gateway, with a documented migration path toward identity, order, tracking, carrier-integration, notification, workflow, API gateway, and AI services.
- Designed event-driven reliability with Kafka domain events, transactional outbox, idempotent APIs/consumers, SQS-style delivery queues, append-only tracking timelines, and replayable async history.
- Modeled the data platform around PostgreSQL as the source of truth, Redis for hot tracking reads/rate limits, S3 for labels/documents/eval datasets, tenant-aware indexes, keyset pagination, optimistic locking, and audit-friendly billing ledger entries.
- Designed AI shipment intelligence features: natural-language shipment assistant, semantic shipment search, logistics knowledge assistant, incident investigator, dispatcher recommendation agent, analytics copilot, and support response drafter with approval.
- Implemented AI safety architecture where AI never writes directly to core databases and acts only through typed, authorized, idempotent tools with tenant ACLs, citations, audit records, approval gates, and rollback paths.

- Designed RAG/AI platform systems including retrieval-service, model-gateway, prompt registry, AI feature flags, eval-service, human feedback loops, hallucination/groundedness checks, Recall@K/MRR/NDCG retrieval evals, semantic caching, model routing, and cost tracking.
- Planned multimodal logistics AI for OCR over labels/invoices/proof-of-delivery forms, document classification, image embeddings for damage/proof search, speech transcription, and guarded voice-agent shipment status flows.
- Instrumented the operating model with OpenTelemetry traces, Prometheus/Grafana dashboards, structured logs, SLOs, workflow metrics, Kafka lag, Redis hit ratio, model latency, token/cost tracking, retrieval quality metrics, and AI eval dashboards.
- Designed production deployment path using Route53, CloudFront/WAF, ALB, EKS ingress, Go services, Python AI workers, RDS PostgreSQL, ElastiCache Redis, managed Kafka, Temporal, S3, CI/CD checks, canaries, prompt/model/retriever rollback, and GitOps-ready packaging.

Education

-
- **Ahsanullah University of Science and Technology, Dhaka, Bangladesh** **2021 - 2025**
Bachelor of Science Industrial & Production Engineering | Graduated:2025

Achievements

-
- **Consistent 5-Star Client Rating on Fiverr/Upwork** **10+ Projects**
 - Delivered backend, cloud, SaaS architecture, and AI-native systems work for international clients across logistics, billing, and real-time intelligence domains.
